DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-5, 7, 19 are rejected under 35 U.S.C. 102(b) as being anticipated by Mosquera et al (US 6,313,400).

Re claim 1, Mosquera et al disclose a housing comprising: at least first and second housing parts (32, 34) detachably connected to one another at a transition (Fig 7), said first and second housing parts each having end surfaces (56, 72) fitting with one another to spread electrical contact on a largest possible surface area therebetween (Figs 7, 8), each of said end surfaces of said first and second housing parts having at least a first and second corresponding bend (90, 94, 104, 106) in order to form an interlocked U-shaped profile (Fig 6) and providing additional protection against electrostatic and electromagnetic disturbances at the transition of the housing parts (Fig 7)(col. 1, lines 30-36).

Re claim 2, wherein said first and second housing parts define an air gap therebetween, said air gap being sufficiently small to allow electrical contact to occur between said first and second housing parts over a substantial majority of said surface area (Fig 10)

Re Claim 3, wherein said end surfaces are at a right angle to said first and second housing parts (Fig 6).

Re Claim 4, wherein said at least one bend is a right angle (Fig 6).

Re Claim 5, wherein said end surfaces are form-locking and have profiles with a number of sides at which electrically conductive contact occurs (Fig 11)

Re Claim 7, wherein at least one of said first and second housing parts is of sheet metal ((Fig 10).

Re Claim 19, a housing comprising: at least first and second housing parts (32, 34) detachably connected to one another at a transition (Fig 7), said first and second housing parts each having end surfaces (56, 72) fitting with one another to spread electrical contact on substantially all of a surface area there-between said end surfaces (Figs, 7, 8), each of said end surfaces of said first and second housing parts having at least a first and a second corresponding bend (90, 94, 104, 106) in order to form an interlock u-shaped profile (Fig 6), and providing additional protection against electrostatic and electromagnetic disturbances at the transition of the housing parts (Fig 7)(col. 1, lines 30-36), said end surfaces being form-locking and having profiles with at least two sides at which electrically conductive contact occurs (Fig 6).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the

Art Unit: 2831

invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claim 6 is rejected under 35 U.S.C. 103(a) as being unpatentable over Mosquera et al. in view of Kaiserwerth et al (US 3,885,084)

The teaching of Mosquera et al as discussed above does not disclose the gap is filled with a formable conductive seal.

Kaiserswerth et al teach the use of a conductive seal (3).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to include the conductive seal with the gap of Mosquera et al for the purpose of enhancing electromagnetic shielding.

Claim 8-18, 20-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Mosquera et al. in view of McMiller et al (US 6,194,653)

The teaching as discussed above does not disclose

wherein one of said end surfaces of at least one of said first and second housing parts has contact elements in conductive contact with another of said end surfaces of a respective other one of said first and second housing parts (Re Claims 8, 20).

wherein said contact elements are disposed along said end surface at regular intervals (re claim 9).

wherein said one of said first and second housing parts having said contact elements is of sheet metal (re claim 10).

wherein at least one of said contact elements is a link plate formed from said sheet metal (re claim 11).

Art Unit: 2831

wherein said contact elements each are link plates formed from said sheet metal (re claim 12).

wherein said at least one contact element has a free end with a contact-forming embossing in a direction of said other one of said first and second housing parts not having said contact elements (re claim 13).

wherein at least one of said contact elements is resilient (re claim 14)

wherein: said one of said first and second housing parts having said contact elements has a given thickness; and said contact elements each have said given thickness (re claims 15, 21).

wherein said contact elements each have free ends with contact-forming embossings; said contact elements lie in a given plane with said one of said first and second housing parts having said contact elements; and said embossings protrude beyond said given plane in a direction of said other one of said first and second housing parts not having said contact elements (re claims 16, 22).

wherein said contact elements are disposed beyond said bend and follow a form of said bend (re claim 17).

wherein said one of said first and second housing parts having said contact elements has an extent from a given portion through said at least one bend to an end; and said contact elements are disposed between said at least one bend and said end and follow a form of said at least one bend (re claim 18).

Re claims 8-18, 20-22, McMiller et al teach the use of a resilient link plate sheet metal contact elements (208)(Fig 3) are disposed along said end surface at regular

Art Unit: 2831

intervals having a given thickness and an embossing (210) protruding beyond said given plane in a direction of said other one of said first and second housing parts. It would have been obvious to one of ordinary skill in the art at the time the invention was made to include the contacting elements with the housing part of Mosquera et al for the purpose of enhancing electromagnetic shielding.

Response to Arguments

Applicant's arguments filed 05-24-06 have been fully considered but they are not persuasive.

Applicant argues (1) that it is not disclosed by Mosquera et al that a first and a second corresponding bend could achieve the object of providing two detachable housing parts for protecting against EMI by forming an interlocked U-shaped profile With respect to (1) see col. 1, lines 30-37.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Hung V. Ngo whose telephone number is (571) 272-1979. The examiner can normally be reached on Monday to Thursday 8:30-6:00.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Dean A. Reichard can be reached on (571) 272-2800 EXT 31. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
